**Connective Tissue Matrix** Aug 22 2022 This book is a sequel to Volume 5 of the series, *Connective Tissue Matrix*. The emphasis in the present volume is on changes which occur in connective tissue matrix and how its components influence biological properties. Changes include alteration of structure and loss of fluid, in response to mechanical loading, and biological changes occurring during development, degeneration and ageing. The chapters illustrate the wide range of disciplines involved in current research but are not intended to provide a comprehensive review of the subject. Volume 11 of the series, *Calcified Tissue*, deals with related tissues whose composition and properties are modified by calcification.

*Lung Connective Tissue* Jan 03 2021 First Published in 1981, this book offers a full, comprehensive guide into the connective tissue of the lung and its relationship to our environment and health. Filled with a vast repertoire of factual data and statistics, this book serves as a useful reference for Students of Medicine, and other practitioners in their respective fields.

*Pathological Basis of the Connective Tissue Diseases* Nov 01 2020

**International Review of Connective Tissue Research** Jan 15 2022 *International Review of Connective Tissue Research*, Volume 1 is a collection of papers that deals with fibroblast, the hormonal control of connective tissues, and calcification of skeletal tissues. One paper reports on the origin, morphology, structure, and the effect of drugs on fibroblasts such as the toxic substance found in sweet pea meal that causes human lathyrism. Another paper discusses hormonal control of connective tissue related to aging, arteriosclerosis, tumors, infection, fertility, and endocrine diseases. The author also describes the repair process of an injured connective tissue; it is characterized by edema, mucinous, and fibrous organization of the extracellular water—a process similar to regeneration and growth. One author describes the structure and general distribution of susceptible blood vessels, as well as, vascular degeneration in diabetes. Another author describes the calcification and formation of bones. He reviews Robison's theory of calcification, the seeding or nucleation concept of calcification, and the role of alkaline phosphatase in calcification. This volume will prove valuable for pathologists, endocrinologists, physiologists, molecular or cellular biologists, gerontologists, and researchers in gene therapy, pharmacology or micro-chemistry.

**International Review of Connective Tissue Research** Mar 17 2022 *International Review of Connective Tissue Research*, Volume 5 presents a detailed review of the end products of collagen metabolism, which is important in understanding certain diseases involving the connective tissues. This book discusses the progress in collagen research. Organized into four chapters, this volume begins with an overview of the metabolism of proline and hydroxyproline that are derived from studies using microorganisms. This text then examines the increasing interest in the more complex tissues and elucidates the marked differences one may expect to find in such tissues. Other.

*International Review of Connective Tissue Research* Jun 08 2021 *International Review of Connective Tissue Research* is a compilation of scientific research mainly focuses on developments in special tissues. A detailed

discussion of the lung and liver is included. Another topic of interest is the liver fibrosis development induced by parasitic infection or alcohol. The periodontal ligament is specialized tissue whose basic role is tooth support. This tissue is covered in detail. A section of the book provides an analysis of the elastin gene expression and regulation. Topics such as the microfibrillar components of connective tissue, the regulation of collagen genes, the complexity and the evolution of the collagen molecule, the invasiveness of malignant tumors, and the characteristics of fibroblast are fully explained. The text presents an exhaustive description of the connective tissue of the lung. This chapter includes a comprehensive description of the pulmonary system. The book will provide useful information to doctors, students, researchers and specialists in the field of human anatomy.

**Abstracts** Feb 22 2020

Aspects of the Connective Tissue of the Heart Apr 25 2020

**Connective Tissue: Types, Functions and Clinical Aspects** Jun 27 2020 The human body is composed of four basic kinds of tissue: nervous, muscular, epithelial, and connective tissue. Connective tissue is the most abundant type and serves as a connecting link for binding, supporting and strengthening all other body tissues. In this compilation, the authors explore connective tissue grafts, a promising and reliable method that provides a satisfactory esthetic outcome, making it a popular option for clinicians. The fundamentals of subepithelial connective tissue grafts, harvesting techniques, clinical success and possible postoperative complications is also discussed.

(Imprint: Nova Medicine and Health)

*Connective Tissue Diseases* Dec 22 2019

*Connective Tissue Disease in Clinical Practice* Sep 30 2020 Connective Tissue Diseases (CTDs) are often still poorly understood and always difficult to manage, however, they are now starting to become increasingly recognised. A CTD is any disease that has the connective tissues of the body as a primary target of pathology, and since these types of tissue include any kind of biological tissue with an extensive extra-cellular matrix that supports, binds together or protects organs, CTDs can prove constantly problematic. Many connective tissue diseases feature abnormal immune system activity, with inflammation in tissues as a result of an immune system that is directed against one's own body tissues (autoimmunity). Connective tissue diseases can be sometimes caused by environmental factors, and can also have strong or weak inheritance risks. CTDs can be very severe in individuals of Afro-Caribbean or South-East Asian origin, therefore there is a very large market opening up for the management of these diseases in China, Singapore, Malaysia, and the Indian sub-continent. There is currently no compact handbook available on the diagnosis and subsequent management of these diseases, and so given the prevalence of CTDs in pockets around the whole world, there is potentially an extensive global market. Rather than focusing on rheumatologists already familiar with CTD, the book would be aimed more at the general clinician and practitioner, equipping them to handle the requirements of the unique treatment, as well as rheumatologist trainees and nurses wishing to specialise.

Connective Tissue Aug 30 2020 This book deals primarily with the principal extracellular macromolecules of animal connective tissues. It attempts to answer some general questions about the biological organization of the tissues: What is the nature of this organization at various dimensional levels? What functions does the organization serve? How has it evolved? I have given major emphasis to the structures and properties of the macromolecular components of extracellular matrices from a wide range of invertebrates and vertebrates. In doing so, however, I have treated cursorily many important aspects of connective tissue biology that appeared to be only indirectly relevant to the principal questions asked. On the other hand, I have not hesitated to search for broad biological principles outside the prevailing conceptual boundaries of animal connective tissues and the lower molecular dimensional levels. The numerous speculations presented will, I hope, stimulate the reader to further thought and investigation. Acknowledgements My previously unpublished data that have been included in this volume could not have been obtained without the generous gifts of specimens and other assistance by a number of individuals and institutions. These are Dr. G. BERENSON of Louisiana State University, Drs. W. P. BRAKER and D. ZUMWALD of the Shedd Aquarium, Dr. S. H. CHUANG of the University of Singapore, Dr. L. G. CLARK and Mr. U. M. VARELA-DIAZ of the University of Pennsylvania, the Government of Nicaragua, Dr. E. CLARK of Cape Haze Marine Laboratories, Mr. C. E.

*Molecular Parameters Indicating Adaptation to Mechanical Stress in Fibrous Connective Tissue* Dec 14 2021 1 Introduction 1. 1 General Remarks The connective and supportive tissues constitute a considerable amount of the biomass in human and animal organisms. Characteristically, the osseous, cartilaginous, and fibrous tissues each connect a vital part (cells) with a non-vital part, i. e. , extracellular matrix (ECM). The composition of the ECM constitutes the mechanical qualities of the respective tissue. The functional role of the bone and cartilage tissues is exhaustively discussed in the relevant literature. Whereas bone tissue provides the static and dynamic stability of the system as a whole, cartilage tissue accounts for the power transfer between bones. The articular cartilage insures a fairly friction free mobility of skeletal elements; likewise, cartilage interposed between skeletal elements allows mobility due to its reversible deformability. Under both static and dynamic conditions, the powers transferred are

remarkably large, while the ensuing mechanical force on various tissue zones varies. Tight connective tissue, especially muscle tendons and ligaments, are also part of the skeletal power transfer system, facilitating the transfer of tensile forces. The tendons of the locomotor system serve the purpose of transferring muscular energy to those skeletal elements to which they are attached. In this function, they are referred to as tensile tendons (“Zugsehnen”). In several body parts, however, tendons appear in a peculiar mechanical situation: they pass around so-called pomochlia, i. e., bony pulleys. Hence, these tendons are referred to as wrap-around tendons (“Gleitsehnen”).

*Cells and Tissues* Sep 23 2022 *Cells and Tissues: An Introduction to Histology and Cell Biology* begins by explaining why histology should be studied. Some chapters follow on the techniques for studying cells and tissues, the anatomy of the cell, the epithelia, the connective tissues, and the blood. This book also covers topics on the immunity against foreign material; contractility, specifically at how it is brought about and at how the system changes in a stationary cell; and harnessing of contraction to produce movement. This text also looks into the communication systems within cells, the life and death of cells, and the histological sections of small intestine. The responses of the body to injury in the processes of inflammation and repair are also explored. This book will be useful to students starting in histology, though it does assume some elementary knowledge of biochemistry and of the structure of the mammalian body.

Connective Tissue Diseases Apr 18 2022 An illustrated guide to the investigation, diagnosis and management of connective tissue disorders. Overview of the general principles of assessment, the main focus is on specific inflammatory diseases affecting the connective tissues. Suitable for rheumatologists, general physicians, hospital pharmacists, doctors in training. -- Provided by publisher.

Connective Tissue Mar 29 2023 Connective tissue is a multicomponent, polyfunctional complex of cells and extracellular matrix that serves as a framework for all organs, combining to form a unified organism. It is a structure responsible for numerous vital functions such as tissue–organ integration, morphogenesis, homeostasis maintenance, biomechanical support, and more. The regeneration potential of connective tissue affects healing of damaged tissue and organs, while trauma, stress, and other factors that cause damage to connective tissue can lead to numerous disorders. *Connective Tissue: Histophysiology, Biochemistry, Molecular Biology* brings together crucial knowledge of mammalian connective tissue (including human) and its components, both cellular and noncellular, in one authoritative reference. The breadth and depth of information has fundamental scientific significance as well as applied relevance in clinical medicine. The first half of the book covers the structure, classification, biochemical aspects, histogenesis, and cellular elements of connective tissue. It presents data from the macro- to nanolevel organization of the extracellular matrix—its structural and functional aspects—and addresses metabolic functions and the biochemistry and molecular biology of connective tissue ageing. The second half of the book reviews current data on the biochemistry and molecular biology of skeletal connective tissue, including bone and cartilage metabolism and regulation. It presents an in-depth analysis of data on the molecular mechanisms of connective tissue ontogenesis, from embryonic development through ageing. It also reports novel findings on bone marrow stroma and describes electron microscopy results of the nanostructure of bone mineral, mineralized cartilage, and teeth compared with coral and seashells. Comprising both classic and modern data on the histopathology, biochemistry, and molecular biology of connective tissue, this book provides a unique resource for clinicians and researchers alike.

**International Review of Connective Tissue Research** Jan 27 2023 *International Review of Connective Tissue Research, Volume 2* is a collection of papers that deals with the morphological background, physiological, and pathological aspects of studies done on connective tissues. One paper discusses the precipitation of collagen fibers from solution — that fibrils form in vitro and in vivo by similar mechanisms. Another paper examines the importance of elastic tissues in the reactions of connective tissue including diseases of the vascular and pulmonary systems. As simple as elastic tissues appear to be, these can be models in studies of the basic structure and function of other more complicated tissues. One author discusses the physiology of the connective tissues of the reproductive tract; he concludes that defects in the connective tissue functions can cause failure in ovulation or the formation of cystic ovaries. Other authors discuss the diseases of collagen and related tissues (rheumatic fever, rheumatoid arthritis, systemic lupus erythematosus, osteoarthritis, osteoporosis), as well as the aging process. One author analyzes the role of collagen fibers in aging: whether factors exist that causes cross-linking or ester cross-links or the dissolution of the collagen macromolecule associated with the aging of collagen. This book can prove helpful for molecular or cellular biologists, pathologists, physiologists, gerontologists, and researchers in gene therapy, pharmacology or micro-chemistry.

**Progress in Heritable Soft Connective Tissue Diseases** Dec 26 2022 This volume is a reference handbook focusing on diseases like Marfan syndrome, Ehlers-Danlos syndrome, Loeys-Dietz syndrome and other heritable soft connective tissue diseases. The book presents detailed information for both basic scientists and for clinicians seeing patients. It is also a stepping stone for new investigations and studies that goes beyond the facts about the composition and biochemistry of the connective tissue and extracellular matrix, as the authors connect individual

components to specific aspects of various soft tissue disorders and to the actual or potential treatment of them. Progress in Heritable Soft Connective Tissue Diseases features very prominent physicians and scientists as contributors who bring their most recent discoveries to the benefit of readers. Their expertise will help clinicians with proper diagnosis of sometimes elusive and uncommon heritable diseases of soft connective tissues. This book also offers an update on the pathophysiology of these diseases, including an emphasis on unifying aspects such as connections between embryonic development of the different types of connective tissues and systems, and the role of TGF-beta in development and physiology of soft tissues. This new set of data explains, at least in part, why many of these disorders are interconnected, though the primary pathophysiological events, such as gene mutations, may be different for each disorder.

**Connective Tissue in Meat and Meat Products** Feb 28 2023 Molecular composition of connective tissues. General aspects of the connective tissue of meat. The structure and function of muscles. Conversion of muscle to meat. Meat and meat connective tissue. Morphological organization of collagenous tissues. Non-collagenous components of meat connective tissue. Elastin. Proteoglycans. Adipose tissue and offal. Molecular and fibre structure of collagen. Genes, biosynthesis and degradation of collagen. Fibre formation and stabilisation of collagen. Elastin, proteoglycans and glycoproteins. Structure and localisation of connective tissue components in muscle. Mechanical and thermal properties of connective tissue. The role of connective tissue in determining the textural quality of meat. The effects of ante- and post-mortem factors on meat connective tissue: growth rate, handling and conditioning. Connective tissue in meat products. Collagen in the diet and nutritional properties of meat collagen. Preparation and analysis of meat connective tissue and collagen types. Physical and sensory methods of analysis.

Fascial and Membrane Technique Dec 02 2020 The fascial and membrane technique developed by Peter Schwind combines the fundamental thoughts from Ida Rolf's Structural Integration with concepts of osteopathy, creating a successful combination of form-stabilizing and mobilizing techniques. The book emphasizes diagnosis and treatment of the breathing patterns manifest in the myofascial system; minimalistic as well as global application joint techniques; visceral techniques in the myofascial context; special treatment techniques in the craniosacral area and care of the upper jaw. Includes comprehensive information on therapy from head to foot with descriptions of the anatomic correlations. Clearly describes the theoretical and practical principles so difficult concepts are easily understandable. Detailed, easily transposed instructions about treatments allow the reader to put the concepts into practice with ease. Photographically documented movements show real examples of topics discussed.

**Initis - Congestion of the Connective Tissues: Pioneers in Manual Therapy Volume II** Feb 16 2022 Dr Rabagliati's book "INITIS - Nutrition and Exercises" first published in 1916, is faithfully reproduced with the original photographs of his self-help exercises. The book is a delightful mix of the scientific and the esoteric, containing his unique viewpoints on the body and its ailments. His work is as valuable today as it was at the beginning of the 1900s.

*Connective Tissue Diseases of the Skin* May 07 2021 Provides fundamental information about the macromolecules and cells composing the connective tissue, and examines the main disorders that directly or indirectly affect connective tissues of the skin and the basement membrane zone.

Wolff's Law and Connective Tissue Regulation Jul 29 2020

*Connective Tissues* Oct 24 2022 connective tissues are essential for the physical functioning of the animals's body. The condition of the various connective tissues is governed by biochemical factors, anabolism and catabolism, that are controlled by specific enzymes. Any change outside the normal range of metabolism, for instance induced by immunological reactions, may induce a pathological disturbance. The result can be acute or chronic inflammation, or loss of normal function, expressed in loosening, dilatation, breaking, wear, stiffness, shrinking, scars, stenosis, and cirrhosis or any other kind of fibrosis. A first step toward improving our understanding of the feedback mechanism that maintains the biological status and texture of a given connective tissue is to combine what is known about synthesis and enzymatic degradation of the components of fibers and ground substance. Common pathological phenomena like chronic inflammation of immune reactions can be either the result of the cause of disturbances in the sensitive balance of connective tissue metabolism. Nowadays connective tissues are less and less regarded as bradytrophic tissue but rather as a stimulating and many-sided problem of research. Before we can understand the pathogenesis of the connective tissue diseases that result in the destructive processes mentioned above, basic research will be necessary. This research will be furthered by a constant exchange of information and the results of observations. To promote this exchange of information between scientists, symposia on connective tissue research are organized at regular intervals.

*Connective Tissue in Health and Disease* Jul 09 2021 This volume provides reviews covering the latest advances in particular areas of connective tissue research. This comprehensive work also includes areas of the medical field in which the basic aspects could be applied. It explains that both cells and matrix are altered in disease states because of the strong interactions established between cells and the extracellular matrix. The aim of this book is to close the existing gap between basic scientists and clinical investigators. This reference is an absolute must for all biological

chemists, clinical investigators, and pathologists. Students of these professions will find this reading both informative and useful as well.

**Connective Tissue Disease** May 27 2020 This book is a collection of works that canvass many of the recent developments in various areas of connective tissue research. It focuses on the structure of the components, molecular organization and pathology of the extracellular matrix.

**Molecular Biology of the Cell** Mar 05 2021

*International Review of Connective Tissue Research* Jul 21 2022 International Review of Connective Tissue Research, Volume 5 presents a detailed review of the end products of collagen metabolism, which is important in understanding certain diseases involving the connective tissues. This book discusses the progress in collagen research. Organized into four chapters, this volume begins with an overview of the metabolism of proline and hydroxyproline that are derived from studies using microorganisms. This text then examines the increasing interest in the more complex tissues and elucidates the marked differences one may expect to find in such tissues. Other chapters consider the process of calcification and the various conflicting theories. This book discusses as well the influence of the impurities, such as fluoride and carbonate, on the nature and formation of biological apatite. The final chapter deals with the contrast between the dynamic state of connective tissue cells and the inert aspect of the intercellular substances. This book is a valuable resource for biochemists, physicians, and surgeons.

**Regenerative Medicine and Biomaterials for the Repair of Connective Tissues** Nov 13 2021 Regenerative medicine for the repair of connective tissues is a fast moving field which generates a lot of interest. Unfortunately the biomaterials and biomechanics for soft tissue repair has been under-represented in the past. Particularly the natural association between cartilage, tendons and ligaments is often not made. Regenerative medicine and biomaterials for the repair of connective tissues addresses this gap in the market by bringing together the natural association of cartilage, tendons and ligaments to provide a review of the different structures, biomechanics and, more importantly, provide a clear discussion of practical techniques and biomaterials which may be used to repair the connective tissues. Part one discusses cartilage repair and regeneration with chapters on such topics as structure, biomechanics and repair of cartilage. Chapters in Part two focus on the repair of tendons on ligaments with particular techniques including cell-based therapies for the repair and regeneration of tendons and ligaments and scaffolds for tendon and ligament tissue engineering. Addresses the natural association between cartilage, tendons and ligaments which is often not made Provides a review of the different structures, biomechanics and practical techniques which are used in the repair of connective tissues Chapters focus on such areas as cartilage repair and regeneration, the repair of tendons and ligaments, investigating techniques including scaffolds and cell-based therapies

**Skin and Connective Tissue** Nov 25 2022 Even a quick look at the surface of human skin reveals its many complexities. Much more than a simple shell for the human body, the skin helps protect internal organs and, working in conjunction with connective tissue, allows the human body to function as a unit. This comprehensive volume examines the components of the human integumentary system, as well as the various diseases and disorders to which it is vulnerable.

**Sweet Spots** May 19 2022 Sweet Spots thinks transversally across language and body, and between text and tissue. This assemblage of essays collectively proposes that words--that is, language that lands as written text--are more-than-human material. And, these materials, composed of forces and flows and tendencies, are capable of generating text-flesh that grows into a thinking in the making. The practice of acupuncture--and its relational thinking--often makes its presence felt to twirl the text-tissue of the bodying essays. Ficto-critical thinking is threaded throughout to activate concepts from process philosophy and use the work of other thinkers (William James, Felix Guattari and Gilles Deleuze, Baruch Spinoza, and Virginia Woolf, to name a few) to forge imaginative connections. Entangled in the text-tissue are an assortment of entities, such as bickering body parts, quivering jellyfish, heart pacemaker cells, a narwhal tooth, Taoist parables, always with ubiquitous, stretchy connective tissue--from goeey interstitial fluid to thick planes of fascia--ever present to ensure that the essaying bodies become, what Alfred North Whitehead calls the one-which-includes-the-many-includes-the-one. The essaying bodies orient towards the sweetest sweet spot which is found, not in the center, but slightly askew, felt in the reverbing more-than that carries their potential. Crucially, this produces a shift in perspective away from self-enclosed bodies and experts toward a care for the connective tissue of relation.

**Ultrastructure of the Connective Tissue Matrix** Apr 30 2023 In recent years, the techniques of electron microscopy have developed so widely and rapidly that they now cover the fields of research once the unique ll:panage of sister research techniques such as biochemistry, physiology, immunology, X-ray diffraction, etc. It is now possible to reach molecular and submolecular levels, making this technique indispensable in every type of research. Electron microscopy alone often provides enough information to solve given problems. In the field of the connective tissue matrix, knowledge of the molecular structure of collagen, pro teoglycans and elastin and their interaction has been to a large extent elucidated by electron microscopy. The field over which electron microscopy ranges in the

investigation of the connective tissue matrix is so wide that the aim of this volume is to collect the main ultrastructural acquisitions disseminated in various journals and monographs in one book. The intent of this volume is to: (a) integrate different and new microscopic methods and review the results of such an integrative approach; (b) present a comprehensive ultrastructural account of selected aspects of the field; (c) point out gaps or controversial topics in our knowledge; (d) outline pertinent future research and expansion of the subject.

**Connective Tissue and Its Heritable Disorders** Feb 04 2021 The Second Edition of *Connective Tissue and Its Heritable Disorders: Molecular, Genetic, and Medical Aspects* is the definitive reference text in its field, with over 40% more pages on the nature, diagnosis, and treatment of disease than its predecessor. Collecting new research on disorders detailed in the first edition as well as on those previously excluded, editors Peter Royce and Beat Steinmann provide the most up-to-date clinical and scientific information for medical specialists treating affected individuals. Features of this revised and updated volume include detailed reviews of the clinical diagnosis, mode of inheritance, risk of recurrence, and prenatal diagnosis of each inherited connective tissue disorder; a thorough description of the morphology of connective tissues; a completely updated and revised section on the biology of the extracellular matrix; and the addition of syndromes such as craniosynostosis, and disorders of sulfate metabolism.

**Immunology of the Connective Tissue Diseases** Aug 10 2021 Connective tissue diseases demand study because of their frequency, morbidity and mortality. They present intriguing challenges in the fields of diagnosis, management and research. Their range has now expanded enormously so that no individual can master the whole subject, particularly as this relates to their immunological basis. *Immunology of Connective Tissue Diseases* has been written by experts who are either clinical or basic scientists. The book presents up-to-date reviews of the immunological basis of connective tissue diseases as it impacts on diagnosis, pathogenetic concepts, disease monitoring and management. The book is aimed at physicians interested in understanding the immunological basis of these diseases, and at immunologists who are either entering this field for the first time and would like to have a convenient state-of-the-art account of its status, or who are researching in one area and would like to acquaint themselves with the developments which have taken place in others.

**International Review of Connective Tissue Research** Jan 23 2020 *International Review of Connective Tissue Research* covers a broad range of aspects of connective tissue metabolism and structure, and other relevant material in the field of connective tissue research. The book discusses topics on the immunological reactions of collagen macromolecules and their degradation products; the factors involved in the specific control of collagen protein synthesis; effect of ionizing radiation on connective tissue components; and the physical properties of connective tissue. Physiologists, pathologists and researchers in the field of medicine will find the book invaluable.

**The Ageing of Connective Tissue** Apr 06 2021

[Connective tissue in rehabilitation](#) Sep 11 2021

**The Connective Tissue** Jun 20 2022

**Connective Tissues in Arterial and Pulmonary Disease** Oct 12 2021 The processes of distention and recoil have an essential role in the functions of arteries and lungs. In both organ systems, these processes involve to a great extent the connective tissues, in particular the manner in which the extracellular materials are arranged to afford such movements. This book concerns the microenvironment of the connective tissues in the walls of arteries and the stroma of lungs. Proteoglycans, collagen, and elastic fibers and their interrelationships are discussed by eight scientists who are established researchers in this area. Their reports include important findings on how this microenvironment is altered in diseases such as atherosclerosis, emphysema, and pulmonary fibrosis. The concepts developed result from studies at the biochemical, macromolecular, ultrastructural, and light microscopic levels. Taken collectively, the reports focus attention upon the role of the connective tissues in arterial and lung distensibility and how alterations in the connective tissues result in the loss of this function. Medical researchers and physicians interested in arterial or lung functions or diseases will find the scientific approaches and findings of the authors innovative and provocative. Students of stereologic morphometry will be particularly interested in the quantitative studies of cells and fibers in arterial walls; histologists and pathologists will find the chapter on histochemical staining interesting from both a scientific and historic viewpoint.
